Social Network Visualization

Overview

Purpose

To map and explore how information circulates across Telegram channels through message forwarding activity

How it works

1. Uses preprocessed Telegram messages

→ Uses curated message data filtered to include only relevant channels (e.g., those with Latin titles).

2. Build the forwarding network

→ Constructs a network where **nodes** represent Telegram channels and **edges** represent message forwarding relationships between them.

3. Detect channel communities

→ Identifies **clusters of interconnected channels** using community detection based on modularity optimization, revealing groups that share or amplify similar content.

4. Prepare for interactive visualizations

→ Exports the resulting network to a **Gephi-compatible format (.gexf)** for visual analysis and interpretation.

Outcome

A **map of Telegram's information ecosystem**, showing how channels are connected and which clusters drive the spread of content.
