Overview

Purpose

To evaluate the **(social) reliability** of Telegram channels by integrating disinformation detection signals with network relationships.

How it works

1. Detect disinformation signals

→ Uses the **WP3 disinformation signals detection tool** to identify potentially misleading content in Telegram messages.

(This step focuses on textual disinformation indicators for efficiency and interpretability.)

2. Aggregate scores by channel

→ Computes an **average disinformation score** for each channel based on the proportion of its messages containing disinformation signals.

3. Integrate with the network structure

→ Merges these scores into the **Telegram forwarding network** (from the visualization tool), assigning each channel its reliability score as a **node attribute**.

4. Identify High-Risk Areas

→ Highlights **channels and clusters** with elevated or neighboring disinformation scores, prioritizing them for deeper qualitative or quantitative analysis.

Outcome

Identifies **likely unreliable channels** and **channels whose neighbors are likely unreliable**, helping pinpoint where disinformation may circulate in the network.

Pipeline
